## ASSIGNMENT 11

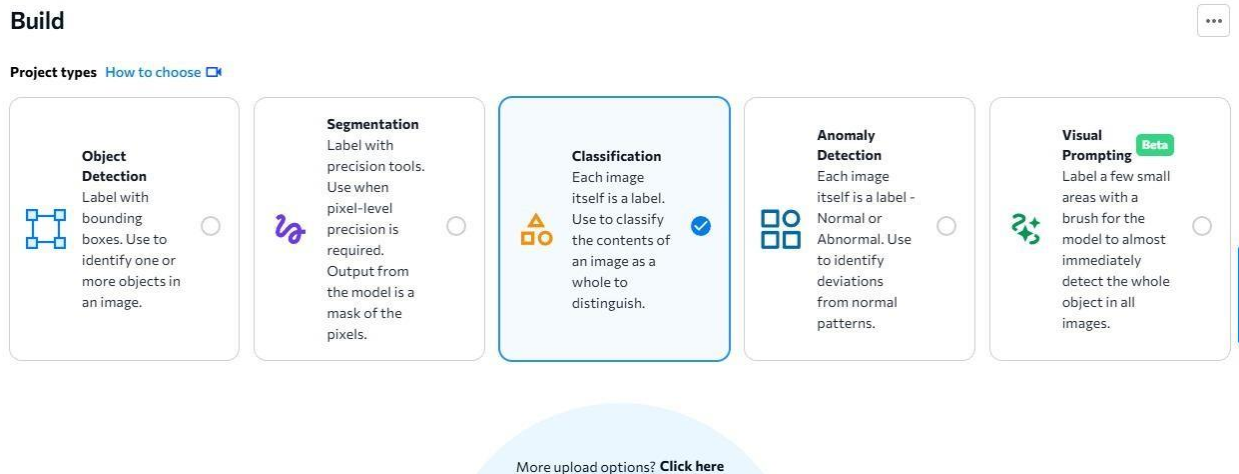

This project focuses on building a classification model using the LandingLens platform to accurately distinguish between images of pens, pencils, and sharpeners. The dataset comprises clearly labeled images for each category, allowing the model to learn and identify unique visual features such as shape, texture, color, and structural design.

By training on these characteristics, the model can determine whether a new image belongs to the "pen," "pencil," or "sharpener" category. The objective is to demonstrate how AI can be applied to image-based classification in real-world educational or stationery-related scenarios, supporting automated organization, tagging, or inventory management of product images.

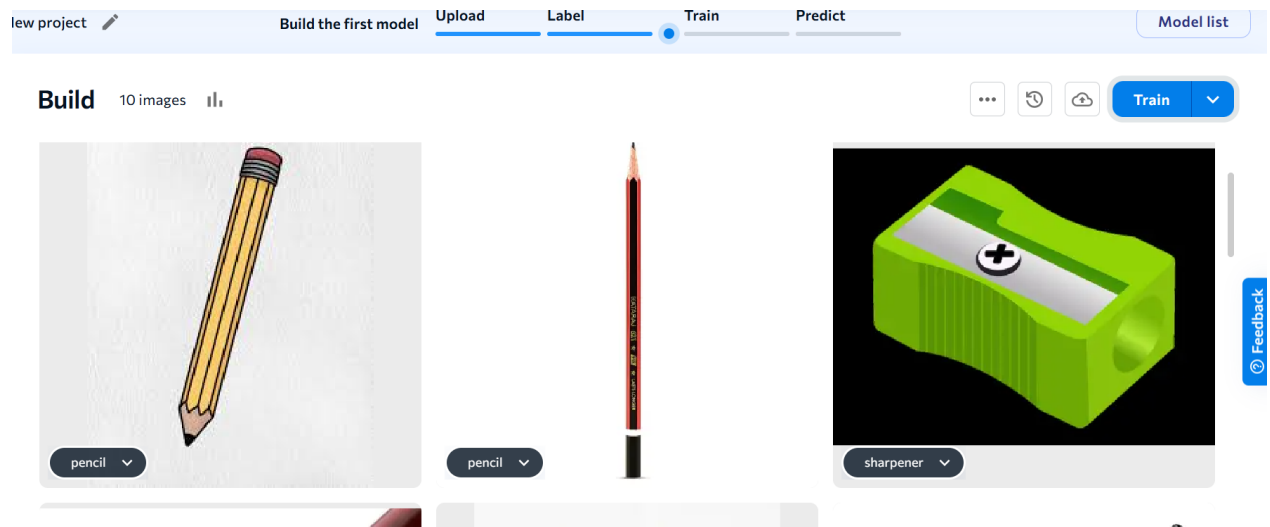

### STEP 1: CREATE A PROJECT

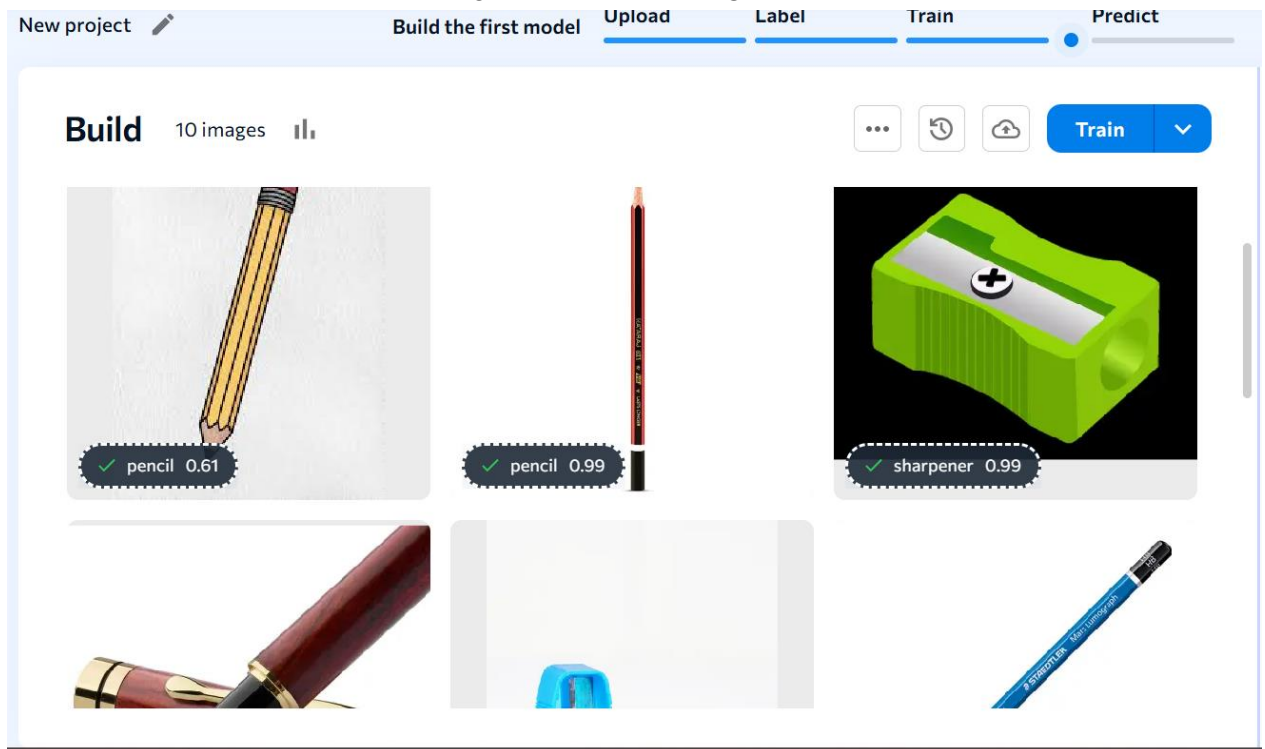

### STEP 2: SELECT A BUILDING MODEL

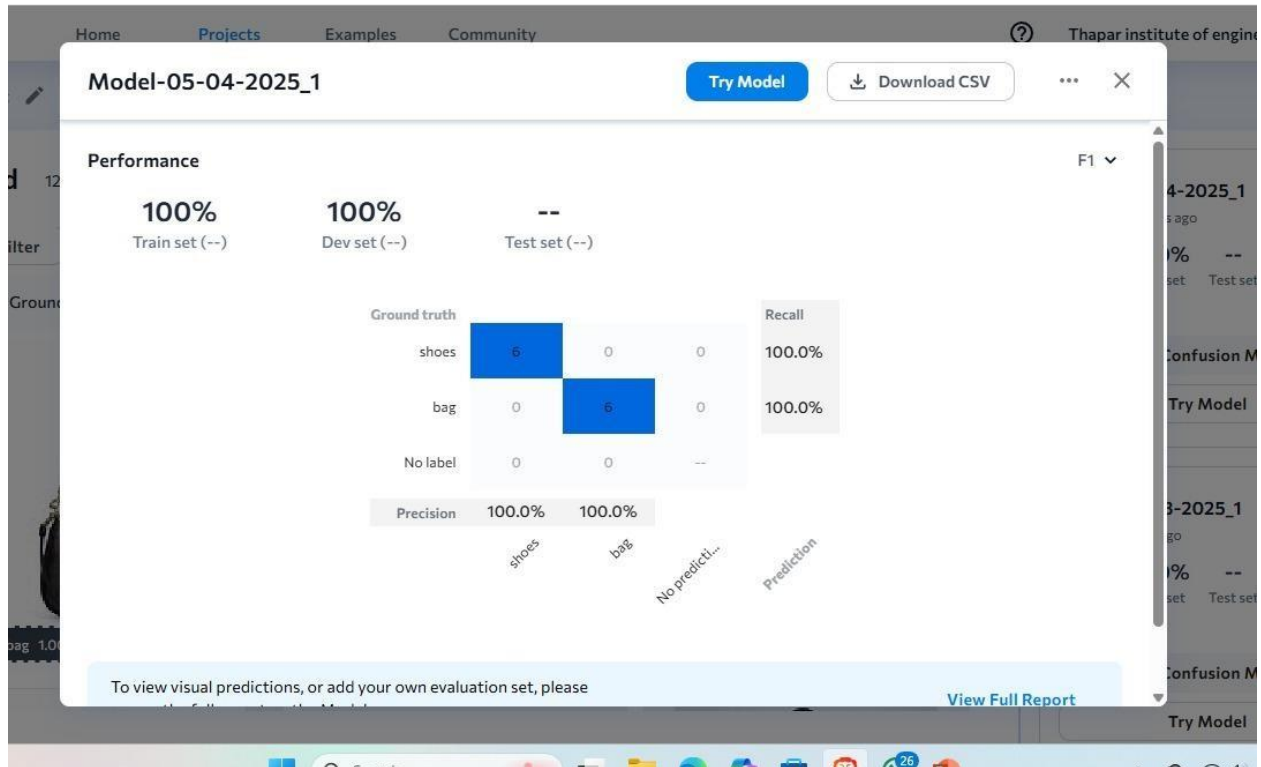

### STEP 3: UPLOAD THE PICTURES AND LABEL IT FOR CLASSIFICATION

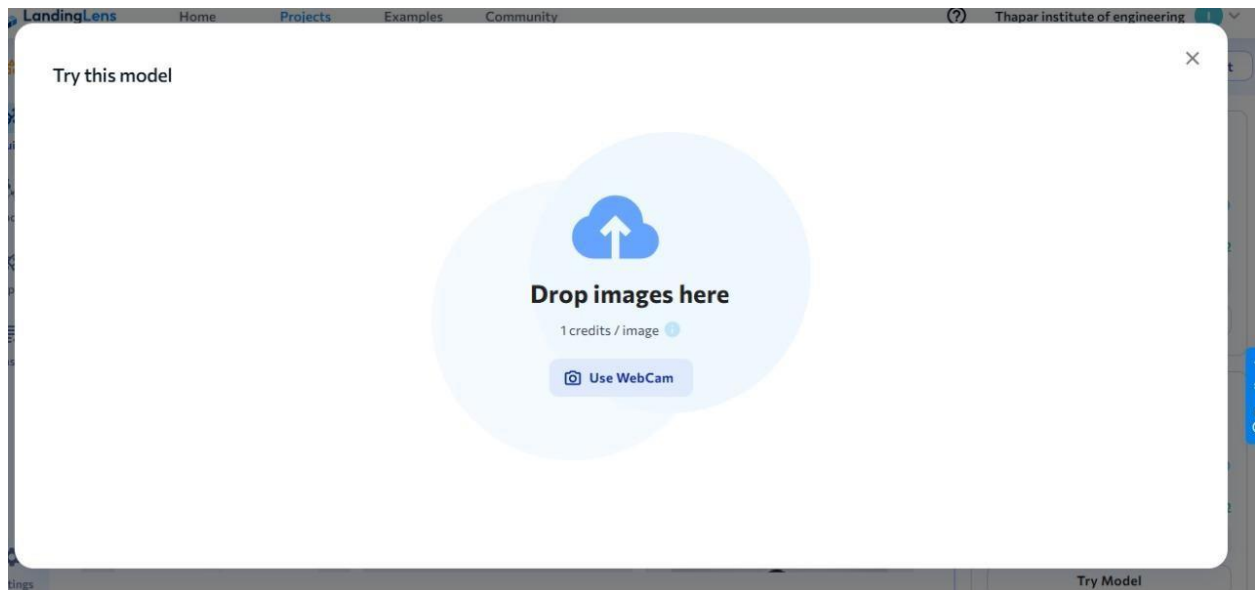

### STEP4 : TRAIN THE MODEL

## STEP 5: TRY THE MODEL

RESULT:

Try this model
